

Clearing Certificates

Brief description

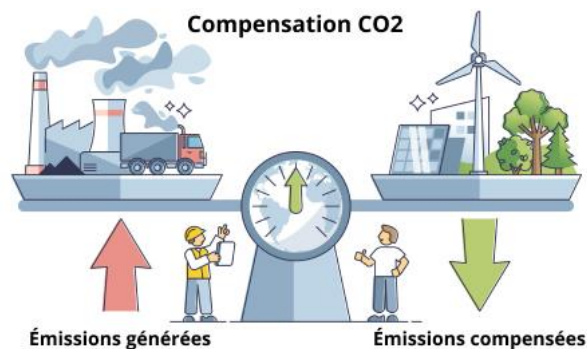

CO₂ emissions are the act of buying reduction certificates (from climate projects) and using them to offset one's own emissions.

There are many projects that produce certificates for compensation, developed according to various standards. The type of project, the standard used and the volume purchased determine the price per tonne of compensation.

Do you want to make a CO₂ product CO₂ neutral or offset your emissions for a particular event? We take care of the administrative process for you.

Your benefits

- Simplification of the administrative management of transactions
- Guarantee that certificates meet international standards
- Communicate your support for emissions reduction projects
- The certainty of using the designation "CO₂ neutral" in accordance with the international criteria in force.

Our know-how

- We are familiar with certification and compensation mechanisms
- We are familiar with international standards and the reputations of the players in place
- We offer a variety of offset projects that allow you to find the right one for you.

Operation

What are clearing certificates used for?

They make it possible to finance climate projects that meet strict criteria (link between the completion of the project and the certificate; certificate of conformity; annual monitoring) regulated by international standards. By purchasing recognised certificates, you are therefore guaranteed to offset your emissions.

What types of climate projects are carried out with the certificates?

A wide range of international projects is available and we can send you examples. These projects are subject to strict standards that guarantee the unique use of each compensated ton. The issuance of certificates is controlled by organizations such as SQS or SGS.
